# Chapter 3: Decision Structures

Starting Out with Java: From Control Structures through Objects

Fifth Edition

by Tony Gaddis

**PEARSON** 

ALWAYS LEARNING

# **Chapter Topics**

Chapter 3 discusses the following main topics:

- The if Statement
- The if-else Statement
- Nested if statements
- The if-else-if Statement
- Logical Operators
- Comparing String Objects

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

3-2

# **Chapter Topics**

Chapter 3 discusses the following main topics:

- More about Variable Declaration and Scope
- The Conditional Operator
- The switch Statement
- The printf Method
- The DecimalFormat Class

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved

# The if Statement

- The if statement decides whether a section of code executes or not.
- The if statement uses a boolean to decide whether the next statement or block of statements executes.

if (boolean expression is true) execute next statement.

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

3-4

# Flowcharts • If statements can be modeled as a flow chart. if (coldOutside) wearCoat(); Wear a coat.

### **Flowcharts** A block if statement may be modeled as: if (coldOutside) Yes Is it cold wearCoat(); outside' wearHat(); Wear a coat. wearGloves(); Wear a hat. Wear gloves. Note the use of curly braces to block several statements together. ©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

# **Relational Operators**

 In most cases, the boolean expression, used by the if statement, uses relational operators.

Relational Operator	Meaning	
>	is greater than	
<	is less than	
>=	is greater than or equal to	
<=	is less than or equal to	
==	is equal to	
!=	is not equal to	

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

# **Boolean Expressions**

• A *boolean expression* is any variable or calculation that results in a *true* or *false* condition.

Expression	Meaning
x > y	Is x greater than y?
x < y	Is x less than y?
x >= y	Is x greater than or equal to y?
ж <= у	Is x less than or equal to y.
х == у	Is x equal to y?
x != y	Is x not equal to y?

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

3-8

# if Statements and Boolean Expressions

```
if (x > y)
    System.out.println("X is greater than Y");
if(x == y)
    System.out.println("X is equal to Y");
if(x != y)
{
    System.out.println("X is not equal to Y");
    x = y;
    System.out.println("However, now it is.");
}
```

Example: AverageScore.java

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

# Programming Style and if Statements

 An if statement can span more than one line; however, it is still one statement.

```
if (average > 95)
  grade = 'A';
```

is functionally equivalent to

if(average > 95) grade = 'A';

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

# Programming Style and if Statements

- · Rules of thumb:
  - The conditionally executed statement should be on the line after the if condition.
  - The conditionally executed statement should be indented one level from the if condition.
  - If an if statement does not have the block curly braces, it is ended by the first semicolon encountered after the if condition.

```
if (expression)
Statement;
No semicolon here.
Semicolon ends statement here.
```

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

### Block if Statements

- Conditionally executed statements can be grouped into a block by using curly braces {} to enclose
- If curly braces are used to group conditionally executed statements, the if statement is ended by the closing curly brace.

22013 Pearson Education Inc. Unper Saddle River, N.I. All Rights Reserved

# Block if Statements

 Remember that when the curly braces are not used, then only the next statement after the if condition will be executed conditionally.

```
if (expression)
statement1; ——Only this statement is conditionally executed.
statement2;
statement3;
```

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

# Flags

- A flag is a boolean variable that monitors some condition in a program.
- When a condition is true, the flag is set to true.
- The flag can be tested to see if the condition has changed.
  - if (average > 95)
     highScore = true;
- · Later, this condition can be tested:
  - if (highScore)

System.out.println("That's a high score!");

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

# **Comparing Characters**

- · Characters can be tested with relational operators.
- Characters are stored in memory using the Unicode character format.
- · Unicode is stored as a sixteen (16) bit number.
- Characters are ordinal, meaning they have an order in the Unicode character set.
- Since characters are ordinal, they can be compared to each other

```
char c = 'A';
if(c < 'Z')
   System.out.println("A is less than Z");</pre>
```

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

#### if-else Statements

 The if-else statement adds the ability to conditionally execute code when the if condition is false.

```
if (expression)
  statementOrBlockIfTrue;
else
  statementOrBlockIfFalse;
```

See example: <u>Division.java</u>

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

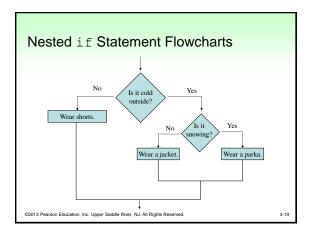

3-16

# Is it cold outside? Wear shorts. Yes Wear a coat.

### Nested if Statements

- If an if statement appears inside another if statement (single or block) it is called a *nested* if statement.
- The nested if is executed only if the outer if statement results in a true condition.
- See example: LoanQualifier.java

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved

# Nested if Statements if (coldOutside) { if (snowing) { wearParka(); } else { wearJacket(); } } else { wearShorts(); } C2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

# if-else Matching

- Curly brace use is not required if there is only one statement to be conditionally executed.
- However, sometimes curly braces can help make the program more readable.
- Additionally, proper indentation makes it much easier to match up else statements with their corresponding if statement.

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

Alignment and Nested if Statements

if (coldOutside)
{
 if (snowing)
 {
 wearParka();
 }
 else
 {
 wearJacket();
 }
 else
 {
 wearShorts();
 }
}

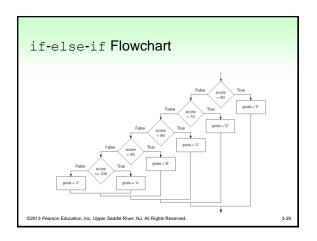

C2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

# if (expression\_1) { statement; statement; etc. } else if (expression\_2) { statement; executed, and the rest of the structure is ignored. etc. } else if (expression\_2) { statement; statement; etc. } Insert as many else if clauses as necessary else { statement; statement; etc. } These statements are executed if none of the expressions above are true. } \*\*C2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved. 3-23

# if-else-if Statements

- Nested if statements can become very complex.
- The if-else-if statement makes certain types of nested decision logic simpler to write.
- Care must be used since else statements match up with the immediately preceding unmatched if statement.
- See example: TestResults.java

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

# **Logical Operators**

- Java provides two binary logical operators (&& and ||) that are used to combine boolean expressions.
- Java also provides one unary (!) logical operator to reverse the truth of a boolean expression.

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

3-26

# **Logical Operators**

Operator	Meaning	Effect	
8.8	AND	Connects two boolean expressions into one. Both expressions must be true for the overall expression to be true.	
11	OR  Connects two boolean expressions into one. One both expressions must be true for the overall expression to be true. It is only necessary for one to true, and it does not matter which one.		
!	NOT	The ! operator reverses the truth of a boolean expression. If it is applied to an expression that is true, the operator returns false. If it is applied to an expression that is false, the operator returns true.	

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

# The & & Operator

- The logical AND operator (&&) takes two operands that must both be boolean expressions.
- The resulting combined expression is true if (and only if) both operands are true.
- See example: LogicalAnd.java

Expression 1	Expression 2	Expression1 && Expression2
true	false	false
false	true	false
false	false	false
true	true	true

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

3-28

# The | | Operator

- The logical OR operator (||) takes two operands that must both be boolean expressions.
- The resulting combined expression is false if (and only if) both operands are false.
- · Example: LogicalOr.java

Expression 1	Expression 2	Expression1    Expression2
true	false	true
false	true	true
false	false	false
true	true	true

2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved

# The ! Operator

- The ! operator performs a logical NOT operation.
- If an expression is true, ! expression will be false.
  - if (!(temperature > 100))
     System.out.println("Below the maximum temperature.");
- If temperature > 100 evaluates to false, then the output statement will be run.

Expression 1	!Expression1
true	false
false	true

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

# **Short Circuiting**

- Logical AND and logical OR operations perform short-circuit evaluation of expressions.
- Logical AND will evaluate to false as soon as it sees that one of its operands is a false expression.
- Logical OR will evaluate to true as soon as it sees that one of its operands is a true expression.

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

3-31

# Order of Precedence

- The ! operator has a higher order of precedence than the & & and | | operators.
- The && and | | operators have a lower precedence than relational operators like < and</li>
   >.
- Parenthesis can be used to force the precedence to be changed.

@2013 Pearson Education Inc Unner Saddle River N L All Rights Reserved

3-32

# Order of Precedence

Order of Precedence	Operators	Description
1	(unary negation) !	Unary negation, logical NOT
2	* / %	Multiplication, Division, Modulus
3	+ -	Addition, Subtraction
4	< > <= >=	Less-than, Greater-than, Less-than or equal to, Greater-than or equal to
5	== !=	Is equal to, Is not equal to
6	&&	Logical AND
7	11	Logical NOT
8	= += -= *= /= %=	Assignment and combined assignment operators.

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

# Comparing String Objects

- In most cases, you cannot use the relational operators to compare two String objects.
- Reference variables contain the address of the object they represent.
- Unless the references point to the same object, the relational operators will not return true.

See example: <u>StringCompare.java</u>
See example: <u>StringCompareTo.java</u>

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

3-34

# Ignoring Case in String Comparisons

- In the String class the equals and compareTo methods are case sensitive.
- In order to compare two String objects that might have different case, use:
  - equalsIgnoreCase, or
  - compareToIgnoreCase
- See example: <u>SecretWord.java</u>

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved

# Variable Scope

- In Java, a local variable does not have to be declared at the beginning of the method.
- The scope of a local variable begins at the point it is declared and terminates at the end of the method.
- When a program enters a section of code where a variable has scope, that variable has come into scope, which means the variable is visible to the program.
- See example: VariableScope.java

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved

# The Conditional Operator

- The *conditional operator* is a ternary (three operand) operator.
- You can use the conditional operator to write a simple statement that works like an if-else statement.

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

# The Conditional Operator

· The format of the operators is:

BooleanExpression ? Value1 : Value2

- This forms a conditional expression.
- If BooleanExpression is true, the value of the conditional expression is Value1.
- If BooleanExpression is false, the value of the conditional expression is Value2.

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

3\_38

# The Conditional Operator

• Example:

```
z = x > y ? 10 : 5;
```

• This line is functionally equivalent to:

```
if(x > y)
  z = 10;
else
  z = 5;
```

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

# The Conditional Operator

 Many times the conditional operator is used to supply a value.

```
number = x > y ? 10 : 5;
```

• This is functionally equivalent to:

```
if(x > y)
  number = 10;
else
  number = 5;
```

See example: <u>ConsultantCharges.java</u>

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

3-40

# The switch Statement

- The if-else statement allows you to make true / false branches.
- The switch statement allows you to use an ordinal value to determine how a program will branch.
- The switch statement can evaluate an integer type or character type variable and make decisions based on the value.

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

### The switch Statement

• The switch statement takes the form:
switch (SwitchExpression)

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

# The switch Statement

```
switch (SwitchExpression)
{
   ...
}
```

- The switch statement will evaluate the *SwitchExpression*, which can be a byte, short, int, long, or char. If you are using Java 7, the *SwitchExpression* can also be a string.
- If there is an associated case statement that matches that value, program execution will be transferred to that case statement.

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

3-43

# The switch Statement

• Each case statement will have a corresponding CaseExpression that must be unique.

```
case CaseExpression:
    // place one or more statements here
break;
```

If the SwitchExpression matches the CaseExpression, the Java statements between the colon and the break statement will be executed.

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

3-44

#### The case Statement

- The break statement ends the case statement.
- The break statement is optional.
- If a case does not contain a break, then program execution continues into the next case.
  - See example: <u>NoBreaks.java</u>
  - See example: PetFood.java
- The default section is optional and will be executed if no CaseExpression matches the SwitchExpression.
- · See example: SwitchDemo.java

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

3-45

# The printf Method

- You can use the System.out.printf method to perform formatted console output.
- The general format of the method is:

System.out.printf(FormatString, ArgList);

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

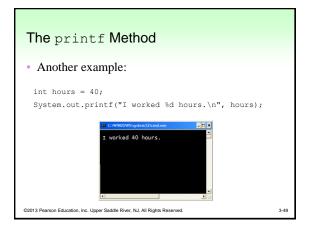

The printf Method

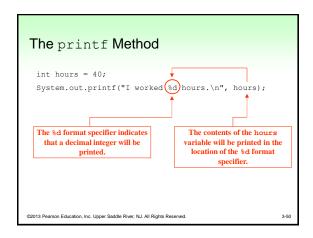

System.out.printf (FormatString, ArgList);

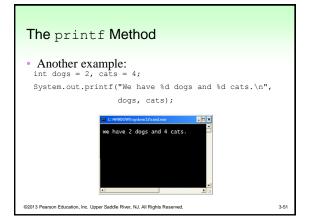

FormatString is a string that contains text and/or special formatting specifiers.

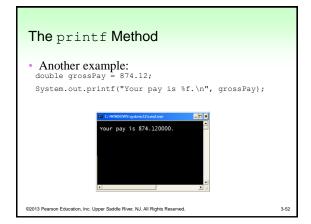

ArgList is optional. It is a list of additional arguments that will be formatted according to the format specifiers listed in the format string.

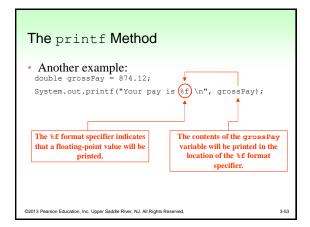

# The printf Method • A simple example: System.out.printf("Hello World\n"); \*\*COMMONOR hydron 27 and an \*\* \*\*Nello World\*\* \*\*Rello World\*\* \*\*COURT Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.

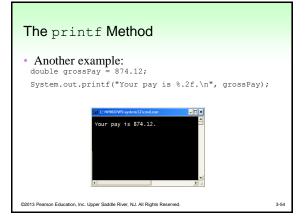

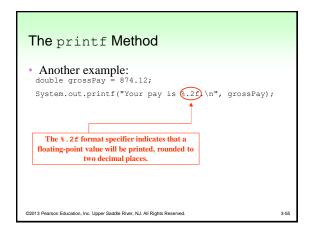

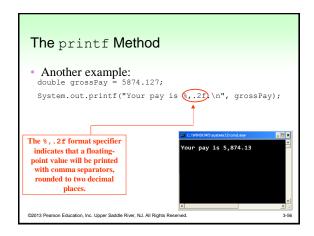

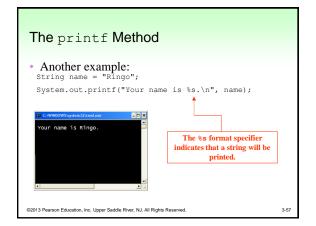

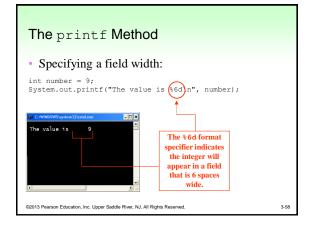

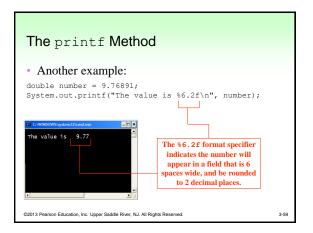

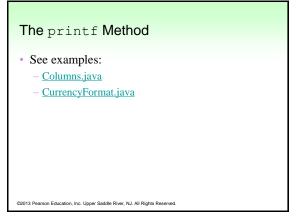

# The DecimalFormat Class

- When printing out double and float values, the full fractional value will be printed.
- The DecimalFormat class can be used to format these values.
- In order to use the DecimalFormat class, the following import statement must be used at the top of the program:
- import java.text.DecimalFormat;
- See examples:

Format1.java, Format2.java, Format3.java, Format4.java

©2013 Pearson Education, Inc. Upper Saddle River, NJ. All Rights Reserved.
